

Business Problem Statement — RetailPulse Analytics

Problem Statement

The business lacks visibility into which customer segments, product categories, and channels are actually driving revenue — and whether current strategies (like the subscription program) are performing as expected. Without this visibility, marketing spend, inventory planning, and customer retention efforts risk being misallocated.

Business Questions

- 1 Which product categories and products generate the most revenue?
- 2 How does purchase behavior differ across gender and age groups?
- 3 Is the subscription program actually driving more revenue than non-subscribers?
- 4 Which shipping preferences and customer segments are most valuable?
- 5 Where should marketing and retention efforts be focused to maximize revenue growth?

Objective

To analyze customer purchase and sales data using Python, SQL, and Power BI in order to:

- Identify top-performing categories, products, and customer segments
- Evaluate the effectiveness of the subscription model
- Provide clear, actionable recommendations to improve revenue and customer retention
